Wild Card GA Assignment

This assignment is intended to achieve better understanding of genetic algorithms, solving problems using evolutionary approaches, as well as practice coding in Common Lisp. Receiving a perfect result is not the main goal.

About the GA

The genetic algorithm developed in this assignment is intended to algorithmically compose music, specifically short melodies. It starts with a collection of randomly generated melodies, the score of a melody is based on how close its Krumhansl coefficient is from the desired manually entered coefficient, the melodies changes slightly each generation with intent to improve its score.

The Tasks

Task 1: Notes —----------

Demo

Behavior of the GA

The fitness metric measures how close the melody's Krumhansl coefficient is from the set desired one, as a result the desired coefficient determines the goal shape that the melody is adapting towards.
